

Pediatric Surgeon Specialist Guide

Think twice
Think MPS II

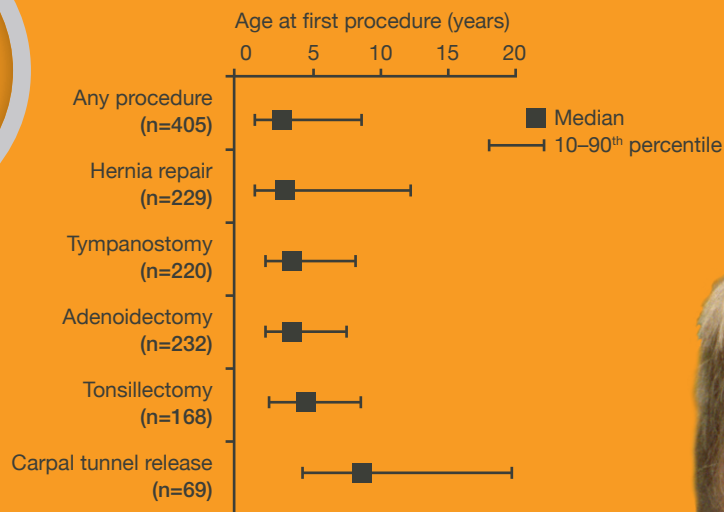

In the Hunter Outcome Survey (HOS), a multinational, observational database of 527 patients, nearly 84% of MPS II patients had undergone a surgical procedure.¹

As a pediatric surgeon, you may be one of the first physicians to suspect MPS II, as the majority of patients (56.8%) underwent at least one surgical intervention before diagnosis of MPS II.¹

HOS data also showed that the median age of first operation was 2.6 years. In young patients (under 3 years) the most commonly repeated surgical procedures were tympanostomy, tonsillectomy, adenoidectomy and hernia repair.¹

In children, the most common cause of carpal tunnel syndrome is an underlying MPS disorder.¹

Operable manifestations such as hernias and otitis media are among the first signs and symptoms to occur in patients with MPS II.¹
